More details: ExtractJPEG is a very simple software application designed to extract JPEG images from database files (MDF format). It features just a few options that can be easily figured out by users, whether they have experience with data extraction software or not. Quick setup and user-friendly GUI The installer does not take a long time to unpack, and its options are standard, so users shouldn't encounter any difficulties in this matter. The interface is not particularly attractive, as ExtractJPEG opts for a regular window with a classical structure. Database files can be pointed out with the help of the file browser only, since the drag-and-drop feature is not supported. Batch processing is not possible, so users are restricted to working with only one file at a time. Seamlessly configure output settings Apart from pointing out the directory and file name of the JPG image, it is possible to change output settings regarding the data segment and gap size. In addition, it is possible to skip the first and every second header. There are no other notable features available here. Evaluation and conclusion ExtractJPEG does not put a strain on PC performance, as it uses low CPU and RAM. Image extraction jobs are carried out quickly, and the app's response time is good. We have not come across any kind of issues throughout our tests, since it did not freeze, crash or pop up error dialogs. However, ExtractJPEG has not been updated for a while. Other than that, it serves its purpose. PLEASE DO NOT HARM OTHER USERS: You may download the free trial version of PacketWin (PW version) and take a look at the settings. If you feel comfortable with the settings, we suggest you purchase the full version of PW. PW is available at and the trial version of PW is available at for NT and Win XP.
