classic portfolio app. Has no way to add contacts (though that could add to its longevity). There is a lot of really great keywording in the earlier versions but it isn't easy to figure out how to use (unlike the new smart select tool in LR which is pretty easy to use). Highly recommended but keep an eye on the App Store, it's easy to pick up the app and give up on it because of unfinished features. This is all I use now, other than Lightroom and Adobe Camera Raw. For me, it's a full working version of the software, perfect for all my needs. I prefer the UI of this version to any other. RawTherapee recently had a major update, and I was excited to say the least. But for me it's not nearly as flexible and artistically pleasing as Photoshop. Reduce the number of different image resolutions you need to use in-house. Even if you have a 4K monitor but have an entire catalog of 8 bit and 16 bit files, many of them share the same settings, making what you'd be saving in memory minimal. A simple change of resolution is sufficient. Print just works. For a while, I felt like it was missing something. Now it has it. No more dealing with resolutions for print output, and fewer drivers to install. All your drivers are built in and are already on the system as needed. You simply tell Photoshop that you've got output to a printer and then you can print normally. In the past, the plug-in panel was scattered all over the place. Each plug-in used its own standard menu that didn't seem to be familiar to anyone. Now, the plug-ins are grouped together into a single, prioritized panel that makes it easy to see an overview of all the plug-ins.

To start off, it's all about controlling the image editing experience directly through your web browser. For this to work we have to bring the whole application to the browser, this includes the UI and features. Realistically we have to serve it to the web as a whole. This means being able to display the UI in different and dynamic ways as users and circumstances change. It also means having to load the images, images like canvas, non-image assets and the layers that we edit directly into the application as well. The last thing is having to constantly keep that program up to date as the code changes. 933d7f57e6
